

IN THE UNITED STATES PATENT AND TRADEMARK OFFICE**ADJUSTABLE WREATH HANGER****BACKGROUND OF THE INVENTION****1. Field of the Invention**

This invention relates to a molded plastic article that is useful for supporting an object such as a decorative wreath or garland against the front surface of a door, over a cemetery headstone, or the like. More particularly, 5 the invention relates to a molded plastic wreath hanger having a rearwardly facing "over-the-door" hook and also having a forwardly facing wreath-support hook, with the distance between the two hooks being selectively adjustable by the user.

2. Description of Related Art

Molded plastic wreath hangers are previously known, having been 10 disclosed, for example, in U.S. Des. 365,015. Because the preferred distance from the top of the door to the forwardly facing support hook on the face of a door can vary according to factors such as the height of the door, size of the wreath, etc., molded plastic wreath hangers made so as to permit selective adjustment of that distance by the user are desirable. In the past, 15 some manufacturers addressed this need by producing molded hangers of different lengths. More recently, U.S. 5,553,823 and U.S. Des. 374,168 disclosed wreath hangers having extension members of predetermined lengths that can be inserted by the user between the "over-the-door" hook and the forwardly facing hook to vary the overall length of the hanger.

SUMMARY OF THE INVENTION

An adjustable wreath hanger, preferably made of molded plastic, is disclosed herein that preferably comprises a hanger strip attachable to the top of a door or other object and a hook strip that slidably engages the hanger strip to permit selective variation of the distance between a rearwardly facing door hook and a forwardly facing wreath hook. The hanger strip preferably comprises a plurality of forwardly facing detent members into which a tooth projecting rearwardly from an engagement tab on the hook strip can be selectively engaged or disengaged to vary the relative positions of the two strips, thereby effectively elongating the length of the wreath hanger.

T08020-6626260

The apparatus of the invention is further described and explained in relation to the following figures of the drawings wherein:

5 FIG. 2 is a right side elevation view of the adjustable wreath hanger of
FIG. 1;

FIG. 4 is a top plan view of the adjustable wreath hanger of FIG. 2;
10 FIG. 5 is an enlarged, cross-sectional view taken along line 5—5 of FIG. 4, with the lower portions of the hook and hanger strips being broken away;

FIG. 6 is a cross-sectional view similar to that of FIG. 5, but with the upper portion of the hanger strip being flexed rearwardly to disengage the tooth of the hook strip from a detent of the hanger strip, thereby permitting the hook strip to be adjusted downwardly relative to the hanger strip; and

FIG. 7 is a side elevation view as in FIG. 2, but shown installed on a door with the hook strip being adjusted downwardly relative to the hanger strip from the position shown in FIG. 2.

20 Like reference numerals are used to indicate like parts in all figures of the drawings.

DESCRIPTION OF THE PREFERRED EMBODIMENTS

Referring to FIGS. 1-4, adjustable wreath hanger 10 of the invention preferably comprises elongated hanger strip 12 and elongated hook strip 14, both of which are preferably injection molded from a suitable thermoplastic resin, most preferably polycarbonate. Hanger strip 12 further comprises a rearwardly facing hook member 26 at its upper end. Hook member 26 is preferably constructed in such manner that it will fit snugly over the top of a conventional door, and sufficiently resilient that it can accommodate doors of various thicknesses within an acceptable, predetermined range. The portion of hanger strip 12 extending downwardly from hook member 26 preferably comprises a detent section 28 having a plurality of vertically separated, forwardly facing detent members 32.

Hook strip 14 further comprises a forwardly facing hook 20 at or near its lower end and an upwardly extending strip portion 18 having disposed near its upper end a resilient engagement tab 16 having a rearwardly facing projection 30, a slide member 22 attached to and cooperating with engagement tab 16 to define an aperture 35 through which downwardly extending detent section 28 of hanger strip 12 is insertable to create an interfering fit between rearwardly facing projection 30 and detent members 32. Slide member 22 preferably further comprises an upwardly extending, resilient backing tab 24 spaced apart from rearwardly facing projection 30, the backing tab biasing an aligned detent member 32 of hanger strip 12 into engagement with rearwardly facing projection 30 of hook strip 14 to maintain a predetermined vertical separation between door hook 26 and hook 20 during use. Rearwardly facing projection 30 and detent members 32 are preferably shaped so as to enable the projection 30, preferably an angular tooth having a width slightly less than the width of strip portion 18, to override detent members 32 whenever the hook strip slides upwardly relative to the hanger strip. Rearwardly projecting bosses 22, 23 on the back of engagement tab 16 assist in keeping strip portion 18 and detent section 28

cooperatively aligned whenever hanger strip 12 and hook strip 14 are moved in slidable relation to each other.

Referring to FIG. 5, when adjustable wreath hanger 10 is constructed as described above, hook strip 14 can be moved upwardly over hanger strip 12 with little effort when not under load to shorten the vertical separation between door hook 26 and hook 20. However, backing tab 24 preferably has a forwardly extending projection 34, visible in FIGS. 2-4, that biases detent members 32 of hanger strip 12 against rearwardly facing projection 30 to prevent hook strip 14 from sliding downwardly in relation to the hanger strip 12 whenever hook 20, visible in FIGS. 1, 2 and 4, is under load. Therefore, in order to increase the vertical separation between door hook 26 and hook member 20 when desired, detent section 28 must first be flexed backwardly away from engagement tab 16 and rearwardly facing projection 30. This adjustment is most easily accomplished when hook 20 is not under load and when door hook 26 is not attached to a door.

Referring to FIG. 6, the application of a rearwardly directed manual force as signified by arrow 36 against detent section 28 causes backing tab 24 to flex rearwardly as well, creating separation between rearwardly facing projection 30 and forwardly facing detent member 32. This separation allows slide 22 of hook strip 14 to be moved downwardly relative to hook strip 12 as indicated by arrow 40. When the desired vertical separation between door hook 26 and hook 20 is achieved, force 36 can be withdrawn, enabling backing tab 24 to bias whatever detent member 32 is then aligned with rearwardly facing projection 30 back into engagement with projection 30, "locking" hanger strip 12 and hook strip 14 back into substantially fixed relation to each other when hook 20 is placed under load.

FIG. 7 depicts adjustable wreath hanger 10 of the invention installed over door 38, with hook strip 14 shifted downwardly relative to hanger strip 12 as compared to the positions depicted in FIGS. 1-4, thereby increasing the vertical separation between door hook 26 and hook 20.

Other alterations and modifications of the invention will likewise become apparent to those of ordinary skill in the art upon reading the present disclosure, and it is intended that the scope of the invention disclosed herein be limited only by the broadest interpretation of the appended claims to

5 which the inventors are legally entitled.
